The Human Life Cycle

Introduction
Like all living things, humans (that’s us) have a life cycle. Every human being goes through the same stages of life in the same order. Most people who live in wealthy countries live to between 60 and 90 years of age, although some people live to be over 100 years of age! Read on to find out about the stages in the human life cycle:

Foetus
All people start off life as a foetus in their mother's belly. A foetus grows in the womb surrounded by liquid and gets its nutrition through a tube called the umbilical cord. When a woman has a foetus growing inside her, we say that she is pregnant. Doctors can take a photo of a foetus using an ultrasound scanner.

Baby
After around nine months (sometimes a bit longer; sometimes a bit less) the mother gives birth. From birth to around two years of age we say a child is a baby (we count people's ages from the day that they are born). Babies cannot do much for themselves and need to be fed (with milk at first, then later with food) and have their nappies changed.

Child
From three years old to twelve years old you are a 'child'. Children are more independent than babies, and they continue to become more independent as they get older; for example, they can eat food that is given to them and dress themselves. Between three and five years old children start to go to nursery and to school.

Teenager
Teenagers are more independent than children; for instance, they can get jobs to earn money for themselves and can learn to drive at sixteen. However, teenagers still live with their parents and rely on them to pay the bills! Knowing which ages are included in the teen years is quite easy, as they end in 'teen' e.g. thirteen.
Adult
Although eighteen and nineteen end in ‘teen’, people of this age are actually now adults. Adults have grown as much as they are going to and usually live independently in their own houses. Most adults get full-time jobs to pay for their own food, bills and other things that they buy. Adults can also have babies of their own!

Elderly
By the age of around 67, most people have worked hard throughout their lives and saved up enough money so that they can retire (stop working). Elderly people are not as strong as when they were younger and get tired more easily. However they can still have fun and stay active, like the couple in the photo. If their children have had children, they will be grandparents.

Summary
In summary, the human life cycle has six main stages: foetus, baby, child, teenager, adult and being elderly. Although we describe the human life cycle in stages, people continually and gradually change from day to day throughout all of these stages.
